PROFiTEST® 0100S-II

Test Instrument for DIN VDE 0100

3-348-888-03
2/3.99

Testing of Residual-Current Protective Devices (RCCBs)

Measurement of contact voltage without tripping the RCCB
Contact voltage with reference to nominal residual current
is measured with 1/3 of nominal residual current.

Trip test with nominal residual current, measurement of time to trip

Special Testing for Systems and RCCBs

Testing of systems and RCCBs
with rising residual current and display of tripping current,
as well as contact voltage at the moment tripping occurs

Testing of RCCBs (10 and 30 mA) with 5 $I_{\Delta N}$

Testing of RCCBs
which are suitable for pulsating DC fault current,
testing is conducted with positive or negative half-waves

Testing of RCCBs with adjustable residual current
for the determination of contact voltage and tripping current

Testing of Special RCCBs

Selective **[S]** SRCDs, PRCDs (Schukomat, Sidos etc.), type G

Testing of RCD Protection in IT Systems

Large Voltage and Frequency Range

An extended-range measuring system allows for use of the test instrument for all AC and three-phase systems with voltages ranging from 65 to 500 V, and frequencies from 15.4 to 420 Hz.

Loop and System Impedance Measurement

Measurement of loop and system impedance can be performed within a range of 65 to 550 V. Conversion to short-circuit current is based upon respective line voltage, as long as the measured line voltage is within the prescribed range. Short-circuit current is calculated from actual line voltage and measured impedance for line voltages outside of this range.

The PROFITEST®DC-II accessory device allows for the suppression of RCCB tripping during measurement of loop impedance.

Insulation Resistance Measurement

with Nominal Voltage and Variable or Rising Test Voltage

Insulation resistance is usually measured with the nominal voltages 500 V, 250 V or 100 V. For measurements at sensitive components, as well as within systems with voltage limiting devices, 22 different test voltages ranging from 20 to 500 V can be selected, which deviate from, and are generally lower than nominal voltage. Measurements can be performed with continuously rising voltage for the detection of weak points in insulation, as well as for the determination of response voltages for voltage limiting devices.

Voltage at the device under test, any detected response or breakdown voltage, as well as insulation resistance appear at the instrument's display, and an LED indicates violation of an (adjustable) limit value.

Low-Resistance Measurements

Bonding conductor resistance and protective conductor resistance can be measured with a measuring current of ≥ 200 mA DC, automatic measuring voltage polarity reversal and selectable conduction direction. Violation of an (adjustable) limit value is signaled with an LED.

Standing-Surface Insulation Measurement

Measurement of standing-surface insulation is performed with actual line frequency and line voltage.

Universal Connector System

The interchangeable plug inserts and the plug-on 2-pole adapter (can be expanded to a 3-pole adapter for phase sequence measurements) allow for use of the test instrument all over the world.

Special Features

Display of allowable fuse types for electrical systems

Start-up testing for energy consumption meters

Calculation of cable lengths for common copper conductor cross-sections

Measurement of biasing, leakage and circulating current up to 1 A, as well as working current to 150 A with the Clip 0100S accessory clip-on current sensor

- Phase sequence measurement (phase sequence, highest line-to-line voltage)
