Screenshot: A: You forgot to add the a tag around the parameter name (last_code): \$html = file_get_contents(""); preg_match_all('/()(.*)()/im', \$html, \$match); print_r(\$match); DEMO: Q: Storing tokens across a particular section in PHP? I've a registration form that creates tokens that I will use in a particular section of a page. For example, after the user has finished entering their details and given a 'submit' button, they're presented with a "Please wait..." message and on refreshing the page they're presented with the next section of the form. The problem is that because I'm using GET for all of the form elements, if the user refreshes the page and performs a GET, there's no way for me to know if they've input a token into the form. I know I could handle this by using POST with hidden inputs and then checking the value of those inputs. But I'm wondering if there's a better approach? My instinct is to simply store those tokens in a different (database?), but I'm not sure if this would cause a problem f678ea9f9e
